cc in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays consists and antagonists to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Cc Agonists and antagonists to the antigens can be screened for The pancreatic cancer antigens can be used to card hybridisation probes that can be used in chromosome mapping, linkage and disponstic methods. The proteins can be used to generate antibodies can disponseric methods. The proteins can be used to generate antibodies can disponseric methods. The proteins can be used to generate antibodies can disponseric methods. The proteins can be used to generate antibodies contributed in vivo and in vitro dispostic and target the polypeptides, including both in vivo and in vitro dispostic and target the polypeptides. The corresponding to the used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or corresponding used in the exemplification of the present invention.

The patent discloses a complex comprising of a B class ephrin and PDZ domain containing protein. B class ephrins function as ligands for Eph receptor tyrosine kinases (RTK) and possess a transmembrane element and a highly conserved cytoplasmic tail at the C-terminus, that contains a PDZ binding site. This complex is used in methods to modulate the interaction of a B class ephrin and PDZ domain containing protein and to identify modulator compounds. It is also used for modulating cellular processes like, axonogenesis, nerve cell interactions and regeneration of nerve cells. The complex is also used for treating proliferative or differentiative disorders associated with this protein complex. The present sequence is the human ephrin B1 C-terminal cytoplasmic domain, comprising conserved sequences reminiscent of known or predicted binding sites for PDZ domains. Ephrin B1 is also known as LERK-2, Elk-L,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified-site

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLG1840-ABIS1515) and the encoded proteins (ABG7037-ABS72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discosticides, therapeutics and pharmaceutical drugs. The invention discosticides genomic DNA sequences (ABL0511), expressed DNA sequences (ABL0511), expressed DNA sequences (ABL05175) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                      Eff-2 (also known as EHK-11) is an Eph transmembrane tyrosine kinase family ligand. It has homology with B61 (Ef1-1) (see AAR82604). Ef1-2 ends in a C-terminal hydrophobic sequence that appears to to be recognition sequence allowing it to be GPI-linked and thus lacking in an intracellular domain. Ef1-2 is useful for identifying other ligands for Ehk-1, -2, -3, Eck and Elk receptors. The ligands are useful in promoting a differential function and/or influencing the phenotye, such as growth and/or proliferation, of receptor bearing cells. They may be used in the diagnosis, and treatment of neurological disorders.

                                                                                                                                                                                                                                                                                                                 The sequence is that of a novel protein designated hek-L, a protein that can bind hek (a cell surface receptor tyrosine kinase). Hek-L is the first known ligand for hek and can be used to study cellular processes regulated by hek (which may be involved in tumorigenesis). It is also an immunogen for antibody production, as a reagent for detecting hek or hek-L in in vitro assays, to determine binding of hek proteins, to purify hek proteins, and to carry diagnostic or cytotoxic agents to particular leukaemia cells that express the hek antigen. Hek-L also binds the elk tyrosine kinase receptors.
                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                       antigen.                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a murine cytokine, Lerk-6, encoded by ART32700. A fragment of murine Lerk-6 DNA was isolated by PCR for use a probe for a human Lerk-6 homologue. The probe however led to the identification of a human Lerk-7 gene (see AAT32699). The Lerk-7 gene and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  neuron; disoraer; injury

The protein may also be used biological activity of such receptors. The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may be treated by

Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the chancement, stimulation, proliferation or growth of cells expressing the each or elk receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating condition, they may be administered to a mammal to exert a trophic conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the elk protein stable receptor. The present sequence represents a

It is the product of a cDNA clone (AAT15008) obtd. from an embryo mid- and hind-brain cDNA expression library. This cDNA is used for the produc. of recombinant Elf-1, which can be used to modulate proliferation, survival and/or differentiation of cells and tissues, and to stimulate or antagonise intracellular signal transduction pathways mediated by the EPH-type receptor.
                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Murine and chicken EPH receptor ligand, Elf-1 - useful in diagnosis and treatment of disorders associated with the Elf-1 gene, e.g. dementia, tachycardia , etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse EPH receptor ligand Elf-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 86; 107pp; English.

The present sequence represents a mammalian EPH receptor ligand designated Blf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are intended funcreasing survival of neuronal cells in culture (e.g. where intended furansplantation), also therapeutically in increase neuron survival (e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of
                                                                                                                                                                                                                                                                                                                                             31-MAY-1995;

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the hek or elk receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neurodegenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LERK-6 polypeptide; hek receptor; elk receptor; human; murine; cell proliferation; neural growth; neural tissue; neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

             AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, pymaecological, cardiant and antiinflammatory activities, and can be us in gene therapy. The polymucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used proteins can be identified. The pancreatic cancer antigens can be used

The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or profliferative, disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A novel chicken EPH receptor ligand, Elf-1 (AAR94767), is involved in the formation and maintenance of ordered spatial arrangements of differentiated tissue. It is the product of a cDNA clone (AAT15009) obtd. from an embryo cDNA expression library. This cDNA is used for the prodn. of recombinant Elf-1, which can be used to modulate proliferation, survival and/or differentiation of cells and tissues, and to stimulate or antagonise intracellular signal transduction

It shares some homology to 2 other EPH receptor ligands, 861 and LERX-2. The E1f-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended for transplantation), also therapeutically in increase neuron survival (e.g. treatment of Alaheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding Elf-1 protein that binds to EPH-type - for production of Elf-1 protein, useful for regulating proliferation, differentiation, and survival of cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of a novel protein designated hek-L, a protein that can bind hek (a cell surface receptor tyrosine kinase). Hek-L is the first known ligand for hek and can be used to study cellular processes regulated by hek (which may be involved in tumorigenesis). It is also an immunogen for antibody production, as a reagent for detecting hek or hek-L in in vitro assays, to determine binding of hek proteins, to purify hek proteins, and to carry diagnostic or cytotoxic agents to particular leukaemia cells that express the hek antigen. Hek-L also binds the elk tyrosine kinase receptors.
